

End-Wheel, No-Till Drill

706/1006NT

Native Grass SERIES III

ORIGINAL INSTRUCTIONS

313-855B
Seed Rate Manual

Rates indicated in the charts are approximate. To assure the most accurate seeding, it is recommended that the drill be calibrated for the desired seed at the time of planting.

Illustrations may show optional equipment not supplied with standard unit.

Introduction

This manual is your guide to no-till drill adjustments for achieving specific seed populations.

Although some setup, operation and adjustment material herein is repeated from the no-till drill Operator's Manual, you need to be thoroughly familiar with no-till drill operations and adjustments before applying this Manual Type Manual and its table data.

Models Covered

This rate manual applies to no-till drill models:

706/1006NT

Document Family

313-855M	Operator's Manual
313-855P	Parts Manual
313-855B	Seed Rate Manual (this document)

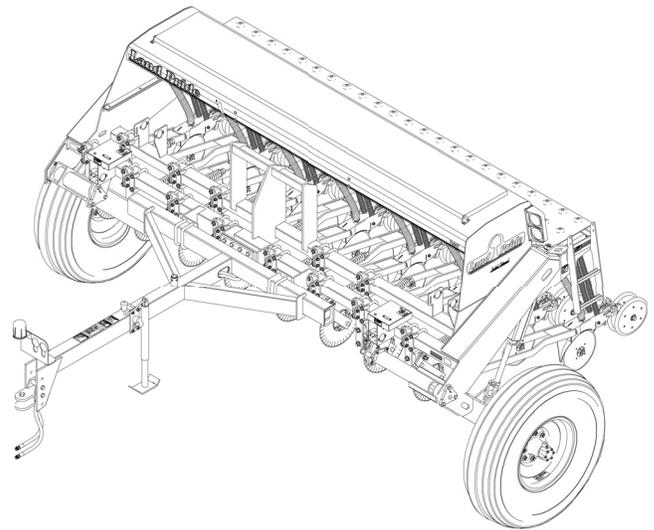

Figure 1

Material Rates Overview

Details of seed and fertilizer rate setting are found in the **Adjustments** section of the Operator's Manual, and rely on data from this Seed Rate Manual.

Rate setting controls are different for each box. Some boxes have more than one control.

All chart rates, for all boxes, are approximate. Land Pride strongly recommends calibration of each box to the material to be applied.

	Main Box Dual Seed (page 2)	Small Seeds (page 29)	Native Grass (page 32)	Fertilizer (page 41)
Rate Range			Seed Rate Reduction	Rate Knob
Coarse Rate	Drive Type	Rate Handle	Drive Type	
Fine Rate	Rate Handle		Driver/Driven	
Cup Adjustment	Door Handle			

Main Seed Box Planting

Calibrating the seeding rate requires four steps:

1. selecting one of four drive types,
2. setting the seed-rate handle,
3. positioning the feed-cup door, and
4. checking the seed rate.

Refer to the seed rate charts beginning on page 6. These charts list the proper drive type and seed-rate-handle settings for various seeds and seeding rates.

The seed rate charts are based on cleaned, untreated seed of average size and test weight. The rates are based on 9.00 x 24 rib implement tires. Many factors will affect seeding rates including foreign material, seed treatment, seed size, field conditions, tire pressure and test weight. Minor adjustments likely will be needed. Set and check the seeding rate using the procedures on page 3, then adjust the rate as necessary.

Select Drive Type

Refer to Figure 2

The gearbox is designed to give you a variety of drive speeds for different types of seeds and rates. It is a linear shift pattern design with constant mesh gearing and totally sealed to keep the dirt out. No lubrication is required unless service is needed.

The gearbox brass indicator plate is positioned so the side with "1" is closest to the center of the drill.

To set the gearbox move the selector handle ① until the desired drive type appears in the window ② on the handle.

Set Seed-Rate Handle

Refer to Figure 3

The seed rate handle controls the percent engagement of the seed sprocket in each seed cup.

1. Loosen wing nut ① under handle.
2. Set indicator ② to just past value from seed rate chart.
3. Tighten wing nut.

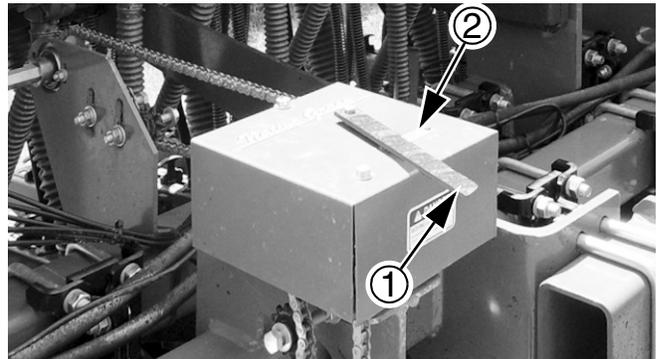

Figure 2
Gearbox Handle Adjustment

21711

Table 1: Gearbox Ratios

Setting 2 is 2.06 Times Faster Than 1

Setting 3 is 3.08 Times Faster Than 1

Setting 4 is 5.03 Times Faster Than 1

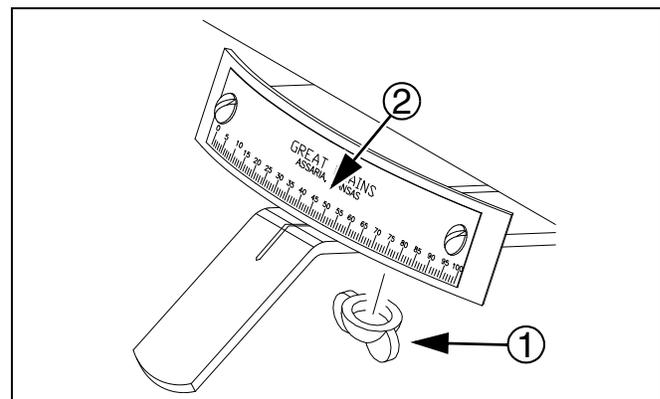

Figure 3
Seed Rate Handle

12927

Position Seed Cup Doors

Refer to Figure 4, which depicts the seed cup door handle in position ③.

At each seed box seed tube, adjust the seed cup door handle ④ for the seed size.

The handle has three normal operating position detents:

- ① (top detent) is for the smallest seeds. Use it for wheat and similar small seeds.
- ② (middle detent) is for larger seeds. Use it for soybeans and similar larger seeds.
- ③ (bottom detent) is for oversize or fragile seeds. If you experience excessive cracking with setting ②, use setting ③.

Note: Handle position ⑤ is used for cleanout, not planting. If set to ⑤ with seed loaded, it may be difficult to reset it to a normal operating position.

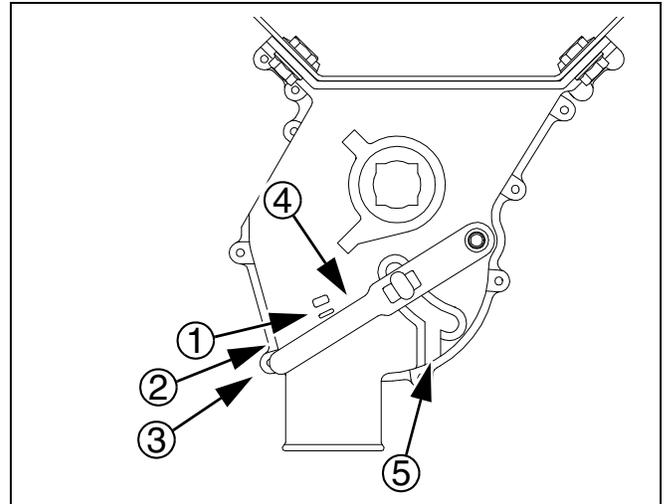

Figure 4
Seed Cup Door Handle

26211

Checking Seed Rate

1. To calibrate, use either the left hand gauge wheel or the supplied calibration crank. If using the calibration crank, attach crank to coupler on gauge wheel jackshaft with retaining pin and disengage lockout on drive wheel.
2. Rotate left hand gauge wheel or calibration crank to see that feed cups and drive are working properly and are free from foreign matter.
3. To adjust seeding rate, decide which drive type (gearbox) setting you need from the seeding charts beginning on page 5. Set the gearbox. Rotate drive tire or calibration crank a few turns to confirm gearbox has engaged.
4. Record weight of an empty container large enough to hold seed metered for one acre.
5. Place several pounds of seed over three seed cups on an outside end of drill box. Pull seed tubes off of these three openers.
6. Turn drive gauge wheel or calibration crank several times to fill seed cups with seed. Turn wheel or crank until seed falls to the ground from each cup.
7. Rotate drive gauge wheel or calibration crank
595 rotations for the 706 and
411 rotations for the 1006.
This is equal to one acre.

Note: You can also rotate the gauge wheel jackshaft by means of a wrench or socket. If rotating gauge wheel jackshaft, disengage the lockout on the drive wheel and use same number of rotations as for rotating drive wheel.

Figure 5
Calibration Crank

Drill Model	Revolutions for One	
	Acre	Hectare
706NT	595	1470
1006NT	411	1016

Main Seed Box Planting

8. Check that the three seed cups have plenty of seed coming into them.
9. Weigh metered seed. Subtract initial weight of container. Divide by three. Multiply by the number of openers on your drill to determine total pounds seeded per acre. If this figure is different than desired, set your seed rate adjustment handle accordingly.

$$\frac{\text{MeasuredSeed} - \text{EmptyContainer}}{3} = \text{PoundsPerSeedCup}$$

$$\text{PoundsPerSeedCup} \times \text{NumberOfOpeners} = \text{PoundsPerAcre}$$

Note: You may want to repeat the calibration procedure if your results vary greatly from seed rate chart.

10. When drilling, check seeding rate by noting acres drilled, amount of seed added to drill and seed level in drill box. If you are seeding more or less than desired, adjust seeding rate slightly to compensate for field conditions.

Rate Charts, Main Seed Box

Metric charts begin on page 43.

Small Seeds Attachment

To set and calibrate the seeding rate on the optional small seeds attachment, follow these steps:

1. To calibrate, use either the left hand gauge wheel or the supplied calibration crank. If using the calibration crank, attach crank to coupler on gauge wheel jackshaft with retaining pin and disengage lockout on drive wheel.
2. Rotate left hand gauge wheel or calibration crank to see that feed cups and drive are working properly and are free from foreign matter.
3. From the small seeds seed rate charts beginning on page 30, find the setting number for desired feeding rate (and row spacing). Move the small seed cup adjustment lever to that setting number.
4. Record weight of an empty container large enough to hold seed metered for one acre.
5. Place several pounds of seed over three seed cups on an outside end of drill box. Pull seed tubes off of these three openers.
6. Turn drive gauge wheel or calibration crank several times to fill seed cups with seed. Turn wheel or crank until seed falls to the ground from each cup.
7. Rotate drive gauge wheel or calibration crank 595 rotations for the 706 and 411 rotations for the 1006. This is equal to one acre.

Note: You can also rotate the gauge wheel jackshaft by means of a wrench or socket. If rotating gauge wheel jackshaft, disengage the lockout on the drive wheel and use same number of rotations as for rotating drive wheel.

8. Check that the three seed cups have plenty of seed coming into them.
9. Weigh metered seed. Subtract initial weight of container. Divide by three. Multiply by the number of openers on your drill to determine total pounds seeded per acre. If this figure is different than desired, set your seed rate adjustment handle accordingly.

Note: You may want to repeat the calibration procedure if your results vary greatly from seed rate chart.

10. When drilling, check seeding rate by noting acres drilled, amount of seed added to small seed box and seed level in small seeds box. If you are seeding more or less than desired, adjust seeding rate slightly to compensate for field conditions.

Native Grass Attachment Series II

The Native Grass box is for seeding fluffy, native grass blends like Big Blue Stem, Indian Grass, and Oats Grama.

Setting Native Grass Rate

Refer to *Figure 7* and *Figure 8*

Seeding rate of the native Grass box is controlled by the gearbox Drive Type ① and a Driven sprocket ② on the gearbox output chain. Rate levers on other boxes do not affect Native Grass rate.

Setting rate for Native Grass mixes (other than Brome) rate requires calibration, which is done using any current Drive Type and Driven sprocket combination. The results of the calibration determine the actual Drive Type and Driven sprocket to use. The process is:

- Meter a sample using the calibration crank.
- Weigh the sample and use that value in the calibration formulas.
- Find the final drive setup in the chart.

A step-by-step table and example follow the detailed Native Grass Mix instructions on page 33.

Instructions and chart for Brome are on page 38.

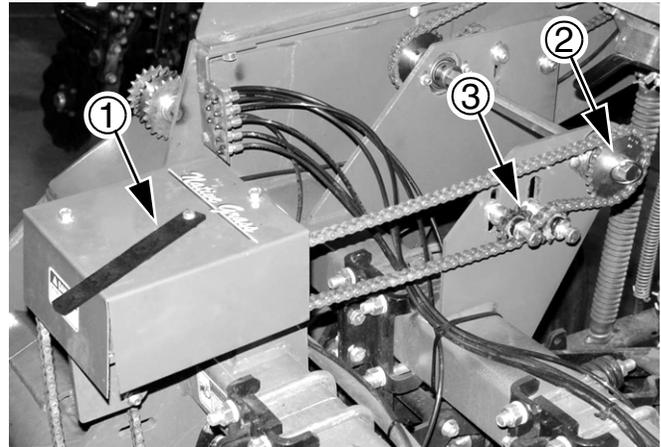

Figure 7
Native Grass Drive Type

20484

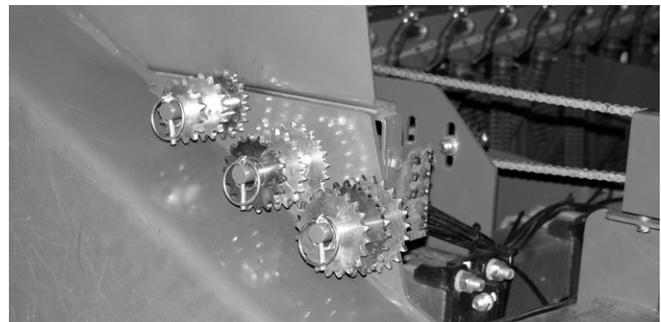

Figure 8
Driven Sprocket Storage

20483

Land Pride Calibration for Series II Native Grass Drills

Our method for calibration will work on any type of native grass no matter what seed type, weight, or density. See page 38 for steps specific to Brome.

We give you the drill's revolutions per acre at the native grass cup and allow you to calibrate the output in pounds by cup sprocket revolution per acre.

This is the most consistent calibration procedure that will work on all types of native grasses.

Note: It is necessary to calibrate for the seed mix before setting seed rate.

To calibrate seed mix:

1. Record the weight of an empty container large enough to hold seed metered from the native grass box.
2. Fill three or more compartments at least $\frac{1}{2}$ full of seed in the native grass box. Pull seed hoses off openers under the compartments.

Refer to Figure 9

3. To calibrate, use right-hand gauge wheel or supplied calibration crank.
4. To calibrate using right-hand gauge wheel, lower the drill hydraulically to planting position in order to activate clutch. Raise right drive wheel tire off the ground using a jack. Engage gauge wheel lockout on the right-hand side.
5. To calibrate using calibration crank, disengage gauge wheel lockout, and attach calibration crank to coupler on right-hand side of gauge wheel jackshaft using retaining pin.
6. Turn gauge wheel or crank several times to fill seed cups with seed. Continue to turn gauge wheel or crank until seed falls to the ground from each cup.
7. Place the empty container under three seed hoses to gather the seed as it is metered.

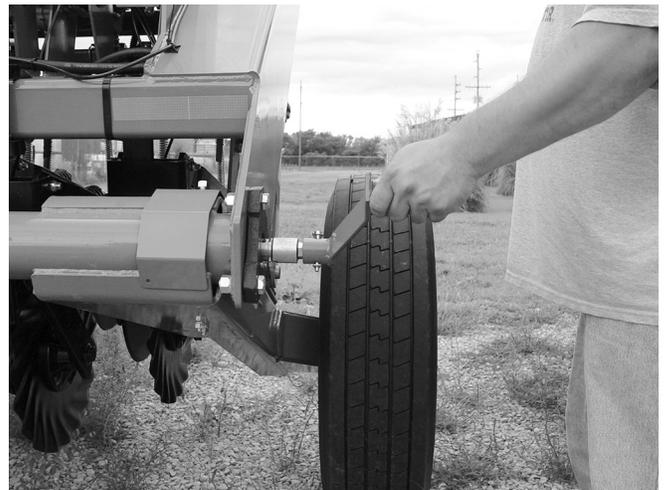

Figure 9
Calibration Crank

23386

Refer to Figure 10

8. Note the Drive Type ① on the gearbox (1, 2, 3, 4) and the range sprocket ② (15 through 24 tooth sprockets). **This information will be used later in the calibration process.**

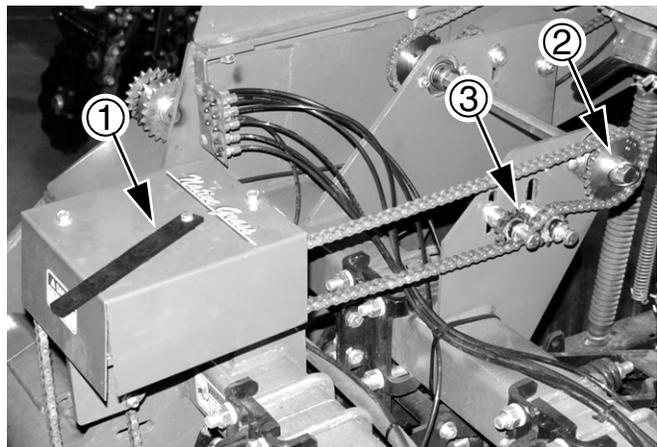

Figure 10
Native Grass Drive Type 20484

- 9. Rotate gauge wheel or calibration crank for one acre. See table at right for rotations per acre.
- 10. Check that the three seed cups have plenty of seed coming into them.
- 11. Weigh metered seed, and subtract the initial weight of the container. Divide this number by 3 (number of cups metered). Finally, multiply by the number of openers on the drill. This equals the pounds per acre at this drive setting. Refer to the formulas on the right.

Drill Model	Revolutions for One	
	Acre	Hectare
706NT	595	1470
1006NT	411	1016

$$\frac{\text{MeasuredSeed} - \text{EmptyContainer}}{3} = \text{PoundsPerSeedCup}$$

$$\text{PoundsPerSeedCup} \times \text{NumberOfOpeners} = \text{PoundsPerAcre}$$

Note: **Refer to the drive setting chart on page 37, the numbers listed are the number of revolutions of the native grass meter shaft at a particular drive type and sprocket range.**

- 12. To adjust this number, take the pounds per acre divided by the shaft revolutions. This is the pounds per shaft revolution.
- 13. Divide desired rate of pounds per acre by the pounds per shaft revolution (this is the number obtained from step 12). Find this number (or the closest number to this) in the drive setting chart. This will give the gearbox drive type and the range sprocket size.

Figure 11
Select NG Driven Sprocket 20483

Refer to Figure 12

14. Set the Drive Type lever to the chart value.
15. Determine which sprocket is required for the native grass box. The sprockets are stored on the right-hand side of the drill frame.

To change sprockets, loosen the chain idlers.

Replace with desired sprocket.

Note: **All native grass mixes will vary in weight, seed type, and density, so this is why you must calibrate each mix.**

16. When drilling, check the amount of seed you are using by noting the acres drilled, amount of seed added to drill, and the level of seed in the box. If you suspect you are drilling more or less seed than desired, and you have accurately calibrated the drill to you seed, you may need to change your sprocket arrangement to compensate for your field conditions.

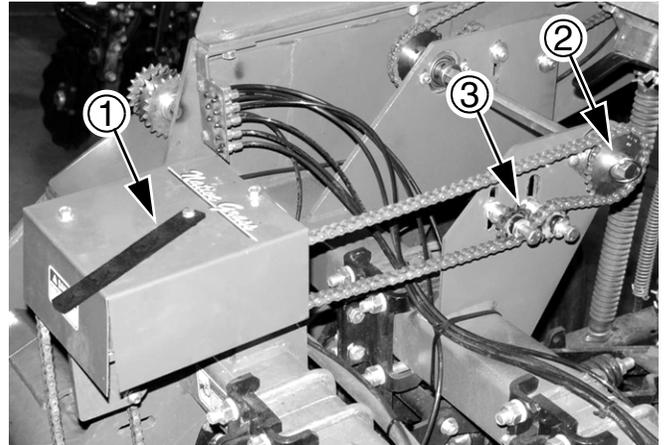

Figure 12
Set Native Grass Drive Type

20484

Calibration Formulas and Sample Calibration

Formulas

Know your Desired seed rate in pounds per acre

Weigh the empty sample container(s)

Operate crank/gauge wheel for one acre

Weigh the collected seed plus container(s)

Calculate the sampled rate at each seed cup.

$$\frac{\text{MeasuredSeed} - \text{WeightOfEmptyContainer}}{3} = \text{SampledPoundsPerSeedCup}$$

Calculate the sampled rate for all rows working:

$$\text{PoundsPerSeedCup} \times \text{NumberOfOpeners} = \text{SampledPoundsPerAcre}$$

Note the current Drive Type and sprocket setting.

In the chart on page 37, find the Cup Revolutions Per Acre for the tested configuration.

Calculate the Sampled pounds per cup revolution

$$\frac{\text{SampledPoundsPerAcre}}{\text{CupRevolutionsPerAcre}} = \text{SampledPoundsPerCupRevolution}$$

Calculate the Target cup revolutions per acre

$$\frac{\text{DesiredSeedRate}}{\text{SampledPoundsPerCupRevolution}} = \text{TargetCupRevolutionsPerAcre}$$

In the chart on page 37, find the table cell with the value closest to the Target. Use the Drive Type and Sprocket shown for that cell.

Factors which will affect seeding rates are: weight of seed, size of seed, relative humidity and moisture content of the seed, ratio of inert material to seed, different proportions of seed types affecting density, tire configuration, tire pressure, and tire slippage.

All seed mixes will vary.

The rates are based on 9.00 x 24 8-Ply tires.

Example

For this example, a target value of:
32 PoundsPerAcre

For this example, three 1.5# buckets:
4.5 pounds

For this example, a model 1006NT:
411 revolutions

In this example:
9.5 pounds

Assuming 3 cups sampled.

$$\frac{9.5 - 4.5}{3} = 1.66(\text{PoundsPerSeedCup})$$

For this example, a 15-row 1006NT:

$$1.66 \times 15 = 24.9(\text{PoundsPerAcre})$$

For this example:

Drive Type 1

Sprocket: 24T

The table cell at Drive Type 1 / 24T is:
50.02 (CupRevolutionsPerAcre)

This is essentially a correction factor:

$$\frac{24.9}{50.02} = 0.498(\text{PoundsPerCupRev})$$

Our Target Cup Rate:

$$\frac{32}{0.498} = 64.28(\text{CupRevsPerAcre})$$

The drive configuration for that target:

Cell: 63.19

Drive Type: 1

Sprocket: 19

Refer to Figure 13

The Series II Native Grass attachment includes this standard agitator.

To prevent damage to the Native Grass box agitator and its drive components, do not transport drill with Native Grass box loaded with seed.

For Native Grass Mix Only

Powdered graphite may be mixed with the native grass seed mix to improve seed flow and metering.

Recommended Usage:

Sprinkle 1/3 cup of graphite per 6 ft of seed box on top of the native grass seed mix.

For humid planting environments, double or triple rate as needed.

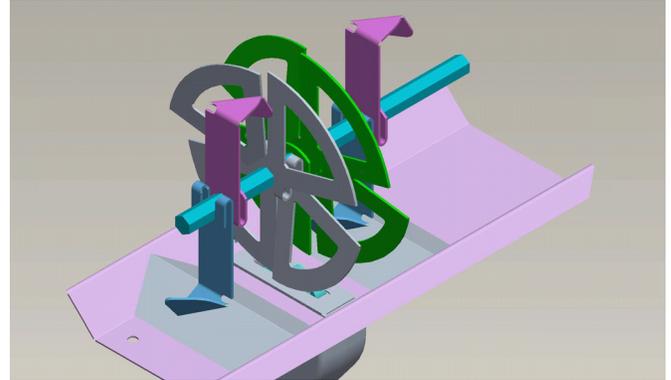

Figure 13
Series II Agitator

25041

Native Grass Cup Rates

Metric charts are on page 69.

Seeding Brome Grass with Native Grass Box

The calibration for seeding Brome Grass differs from the native Grass Mix calibration. The chart provides an initial (pre-calibration) value in pounds per acre.

To adjust seeding rate:

1. Find the desired pounds per acre on the Brome Grass Rate Chart (page 40).

Refer to Figure 15

2. Determine which Driven sprocket ① is required for brome grass. The sprockets are stored on the right-hand side of the drill frame.

To change sprockets, loosen the chain idlers ②.

Replace with desired sprocket ①.

Refer to Figure 14

3. Move gearbox selector handle ③ to desired drive type.

Checking Seed Rate

4. Record weight of an empty container large enough to hold seed metered for one acre.
5. Fill three or more compartments at least 1/2 full of seed at the outboard end of the box. Pull seed tubes off the openers under the compartments.
6. To calibrate, use right-hand gauge wheel or supplied calibration crank.
7. To calibrate using right-hand gauge wheel, lower the drill hydraulically to planting position to activate clutch. Raise right drive wheel tire off the ground using a jack. Engage the gauge wheel lockout on the right-hand side.

Refer to Figure 16

8. To calibrate using calibration crank, attach calibration crank to coupler on right-hand side of gauge wheel jackshaft using retaining pin.
9. Turn gauge wheel or crank several times to fill seed cups with seed. Continue to turn wheel or calibration crank until seed falls to the ground from each cup.
10. Place empty container under the three seed tubes to gather seed as it is metered.
11. Rotate gauge wheel or calibration crank one acre. See table at right for revolutions per acre.

Note: You can also rotate the gauge wheel jackshaft by means of a wrench or socket. If rotating gauge wheel jackshaft, disengage the lockout on the drive wheel and use same number of rotations as for rotating drive wheel.

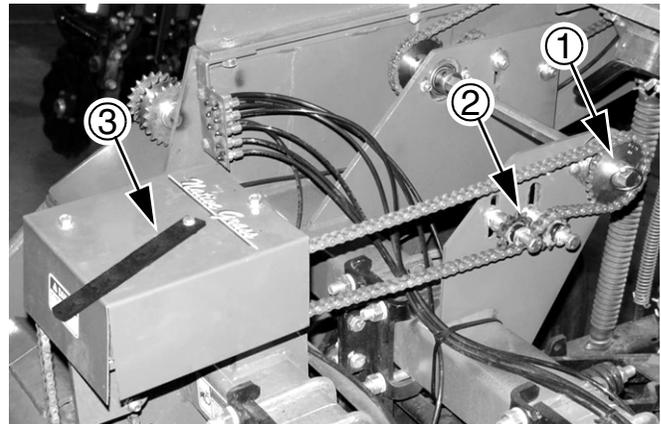

Figure 14
Brome: Drive Type 20484

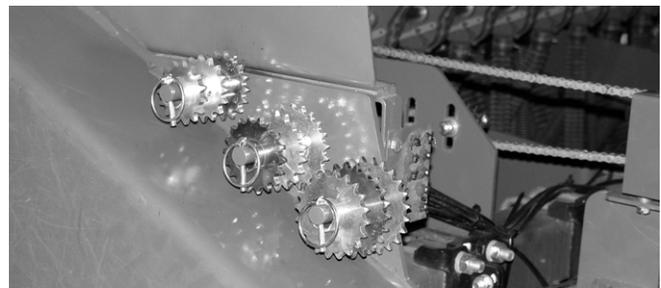

Figure 15
Brome: Sprocket Storage 20483

Figure 16
Brome: Calibration Crank 23386

Drill Model	Revolutions for One	
	Acre	Hectare
706NT	595	1470
1006NT	411	1016

12. Check that the three seed cups have plenty of seed coming into them.
13. Weight metered seed. Subtract initial weight of container. Divide by three. Multiply by the number of openers on the drill to determine total pounds seeded per acre. If this figure is different than desired, change your sprockets and drive type accordingly.

$$\frac{\text{MeasuredSeed} - \text{EmptyContainer}}{3} = \text{PoundsPerSeedCup}$$

$$\text{PoundsPerSeedCup} \times \text{NumberOfOpeners} = \text{PoundsPerAcre}$$

Note: You may want to repeat the calibration procedure if your results vary greatly from seed rate chart.

The chart on page 40 is to be used as a reference to your own brome grass mix. All brome grass mixes vary so this is why you must calibrate each mix using the chart only as a starting point.

14. When drilling, check the amount of seed you are using by noting the acres drilled, amount of seed added to drill, and the level of seed in the box. If you suspect you are drilling more or less seed than desired, and you have accurately calibrated the drill to your seed, you may need to change your sprocket arrangement to compensate for your field conditions.

Factors which will affect seeding rates are: weight of seed, size of seed, relative humidity and moisture content of seed, ratio of inert material to seed, different proportions of seed types affecting density, tire configuration, tire pressure, and tire slippage.

All seed mixes will vary.

The rates are based on 9.00 x 24 8-Ply tires.

Fertilizer Rate

Fertilizer application rates will vary with fertilizer type, density and particle size. Relative humidity and field conditions can also affect application rates. The chart on page 42 is based on material with a density of 65 pounds per cubic foot (1.04 kg/L) and average particle size. Initially set rate according to the charts, then calibrate the drill to your material as described below.

Refer to *Figure 17*

1. To calibrate using gauge wheels, raise drill with tractor hydraulics so drive wheels are off the ground. To calibrate using supplied calibration crank, attach crank to coupler on gauge wheel jackshaft with retaining pin. Disengage lockout on the drive wheels.
2. Rotate drive wheels or calibration crank to see that metering system is working properly and free from foreign material.
3. From the chart on page 42, find the setting number for your row spacing and desired application rate. Rotate gate adjustment knob to the number obtained from the chart.
4. Check that gauge-wheel tires are the correct size and properly inflated. Refer to “**Tire Inflation Chart**” in the operator’s manual.
5. Record the weight of an empty container large enough to hold fertilizer metered for one acre.
6. Place several pounds of fertilizer over three fertilizer feed cups on outside end of drill box. Pull fertilizer tubes off these three openers.
7. Turn gauge wheels or calibration crank a few turns to fill feed cups with material. Continue to turn until fertilizer drops to the ground from all three tubes.
8. Place a container under the three tubes to gather metered fertilizer.
9. Turn gauge wheel or calibration crank for: 595 rotations for the 706 drill and 411 rotations for the 1006 drill. This is equal to one acre.
10. Check that the three feed cups have plenty of fertilizer coming into them.
11. Weigh metered material. Subtract initial weight of the empty container. Divide by 3. Multiply by the number of openers on your drill to determine total pounds-per-acre metered. If this figure is different than desired, reset adjustment knob accordingly.

Figure 17
Calibration Crank

23386

The fertilizer rate chart is for granular fertilizer with a density of 65 pounds per cubic foot (1.04 kg/L). If you are applying fertilizer with a different density, use the density conversion chart.

Note: You can also rotate the gauge wheel jackshaft by means of a wrench or socket. If rotating gauge wheel jackshaft, disengage the lockout on the drive wheel and use same number of rotations as for rotating drive wheel.

Drill Model	Revolutions for One	
	Acre	Hectare
706NT	595	1470
1006NT	411	1016

$$\text{PoundsPerDropTube} \times \text{NumberOfTubes} = \text{PoundsPerAcre}$$

Fertilizer Rate Chart

Metric chart is on page 70.

Density Conversion Charts

The fertilizer meter rate charts are based on fertilizer with a density of 65 pounds per cubic foot (1.04 kilograms per liter). If you are applying fertilizer of a different density, use the following table to convert application rate.

Density, lb/ft ³	45.0	50.0	55.0	60.0	65.0	70.0	75.0	80.0
Conversion Factor	1.45	1.30	1.20	1.10	1.00	0.93	0.87	0.81

Example: Your fertilizer has a density of 75 pounds per cubic foot, and you want to apply 100 pounds per acre. Multiply the desired application rate by the conversion factor.

$$100 \times 0.87 = 87$$

Adjust drill to the setting closest to 87 pounds per acre.

Metric Rate Charts

Metric Rate Charts, Main Seed Box

Main seed box instructions are on page 2.
Charts in U.S. customary units begin on page 5.

Density Conversion Charts

The fertilizer meter rate charts are based on fertilizer with a density of 1.04 kilograms per liter. If you are applying fertilizer of a different density, use the following table to convert application rate.

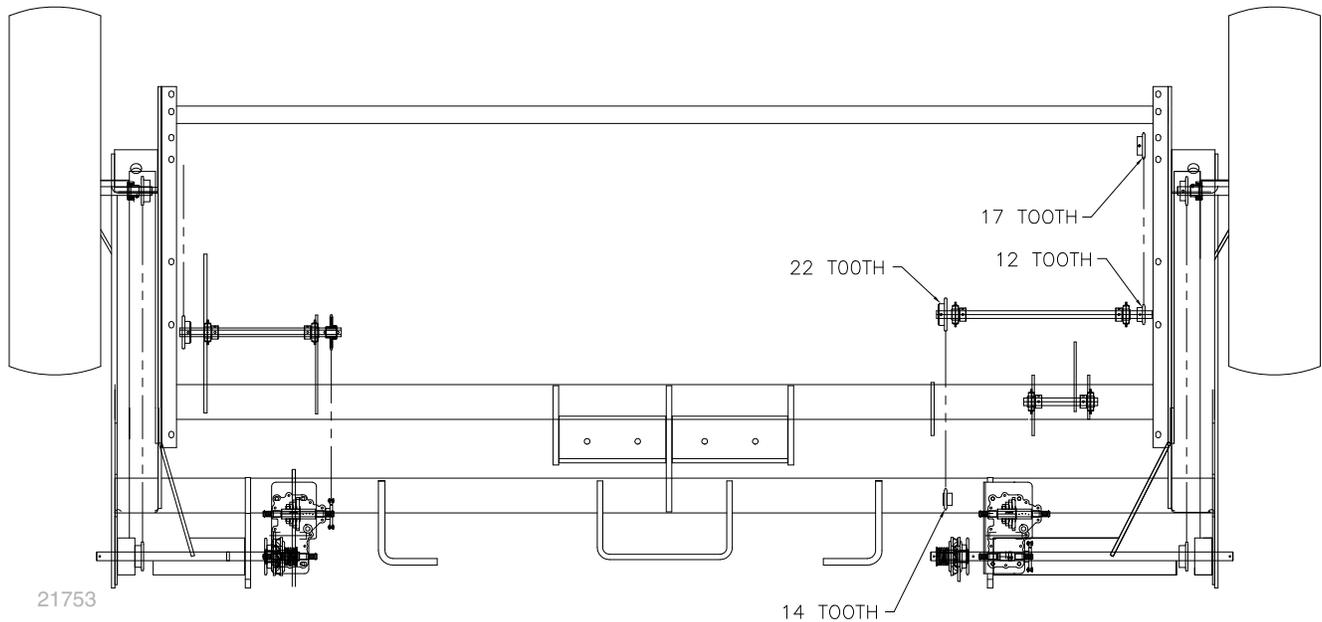

Density, kg/l	725	800	875	950	1041	1125	1200	1275
Conversion Factor	1.44	1.30	1.19	1.10	1.00	0.93	0.87	0.82
